

Cocasset Street Flooding at Maple Place Project

What is this project?

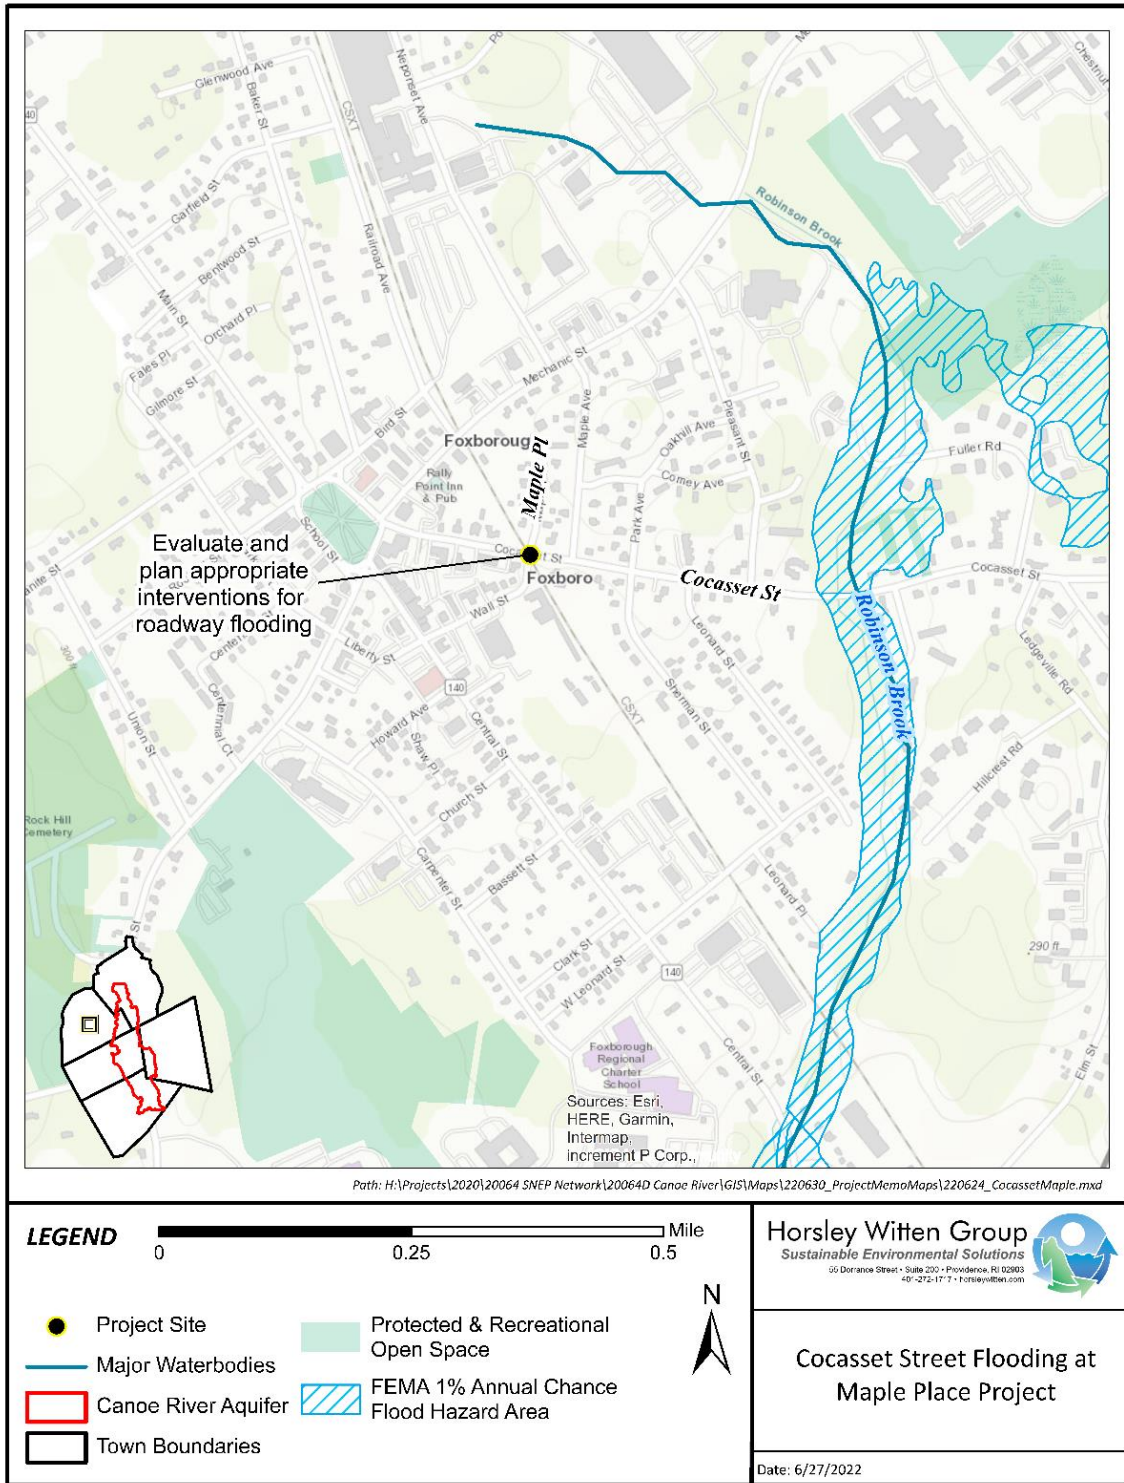

The Cocasset Street Flooding at Maple Place Project Cluster includes one area with poor drainage and reported flooding issues at the railroad crossing in Foxborough, MA. Flooding in this area results from inadequate drainage infrastructure. This area should be assessed to determine if stormwater retrofits, including green infrastructure, could be implemented to reduce flooding and improve infiltration on the site. A site visit and more information are needed to understand the cause of flooding at this identified flood hazard area and inform the most appropriate flood reduction interventions needed to alleviate roadway flooding and freezing.

Why is this project important for the environment and Foxborough?

- **Reduced flood hazard.** Town staff and community members have identified this site as a problem flooding area. Appropriate flood reduction efforts can alleviate street flooding, reducing traffic hazards during wet and freezing conditions.
